Keeping pressure under control

AN ISO 9000 COMPANY
Bailey & Mackey have been manufacturing high quality pressure instruments for over 75 years. The product range has been extended over this period and we now manufacture Pressure Gauges, Temperature Gauges, Pressure Switches and Pressure Transducers.

Our products satisfy most pressure and temperature sensing applications in many industrial markets including, Aerospace, Automotive, Chemical, Marine, Medical, Water, Waste, Fire, Food, Heating and Ventilating, and General Industries. In fact we have products which cover almost every pressure sensing application.

Expertise in pressure sensing technology enables us to manufacture to the highest standard of quality and reliability.

Our quality management system, which is approved by B. S. I. Quality assurance to BS EN 9001, ensures that all products have been correctly assembled and tested prior to despatch to our customers.

Bailey & Mackey aims to lead its chosen sectors of the Pressure Gauge, Temperature Gauge, Pressure Switch and Pressure Transducer Industry through excellence in customer service and product quality.

Bailey & Mackey – Pressure control experience and innovation for over 75 years

Cert No. FM 59294
Bourdon Tube Pressure Gauges measure pressures relative to atmospheric pressure and are divided into three groups, each group being based on a different measuring principle.

Bourdon Tube Gauges consist of a formed tube with one end fixed and the other end free to deflect under pressure. This type of gauge is only available for applications where the material of the tube (e.g. Beryllium Copper or Stainless Steel) is compatible with the fluid in the system. The maximum pressure that we manufacture these gauges to is 700 bar (10000 psi). Illustrated in this Catalogue.

Diaphragm Gauges consist of a metal diaphragm which deflects under pressure. This type of gauge is extremely versatile as materials and coatings can be used which will resist corrosion and consequently can be adapted for use with the majority of fluids. The maximum pressure that we manufacture these gauges to is 70 bar (1000 psi). Illustrated in our Diaphragm Gauge Catalogue.

Bellows Gauges consist of a metal bellows which expand/contract when pressure/vacuum is applied. This type of gauge is used for low pressures up to 500 mbar (200 in.H₂O). Illustrated in our Diaphragm Catalogue.

All Bailey & Mackey Pressure Gauges can be supplied for measuring vacuum although absolute pressure gauges are not included in our range.

Temperature Gauges utilise both the bourdon tube and vapour pressure principle. A temperature sensing element is connected to the bourdon tube via a length of capillary or rigid stem. Liquid contained in the element, when subject to heat, converts to a gas pressure which deflects the tube. Illustrated in our Temperature Gauges Catalogue.

Bailey & Mackey Pressure and Temperature Gauges can be modified to suit almost any requirement. Please contact our Sales Office for technical assistance.

</table>
Bailey & Mackey’s range of Bourdon Tube Pressure Gauges are built to the highest standards of workmanship required for such precision instruments. Each individual Pressure Gauge is subject to a series of most stringent pressure and calibration tests before dispatch.

Applications

Bourdon Tube Pressure Gauges with brass connections and phosphor bronze tubes are suitable for use on air, water, oils and other fluids compatible with these materials.

When used on steam a syphon should be fitted and filled with water prior to use. Pressure Gauges manufactured in stainless steel are for use with corrosive fluids or in corrosive environments or where food or hygiene requirements demand a higher specification.

Vacuum

All sizes of Bourdon Tube Pressure Gauges can be supplied for indication of vacuum relative to atmospheric pressure.

Gauges calibrated 0–30in Hg or 0–760mm Hg will, normally, have their pointers moving clockwise on increasing vacuum. Gauges calibrated 0–1 bar have their pointers moving anti-clockwise. Absolute Pressure Gauges are not included in the Bailey & Mackey range.

Combined Pressure And Vacuum

On some applications there may be a requirement for indication of both pressure and vacuum in one instrument.

Please contact our sales office for further information.

Working Pressure

It is recommended that the gauge range should be chosen so that the working pressure is not more than 65% of the maximum scale value for fluctuating pressures or 75% for steady pressures.

Accuracy

Bailey & Mackey Bourdon Tube Pressure Gauges are normally supplied to the accuracy laid down in BS EN837.

See relevant page for accuracy.
Temperature

Gauges should not be exposed to excessive heat or cold since this causes them to indicate incorrectly. Excessive heat could cause the solder which is used to join the tube to the connection to melt. Gauges containing liquids should not be exposed to cold as the liquid could solidify and damage the tube.

Gauges should be mounted away from heat sources either via a sufficient length of capillary to keep the gauge cool, or in the case of steam, fitted with a syphon tube which is filled with distilled water prior to use.

Energy Release Device

It is a requirement of BS EN837 that gauges 100mm diameter and above shall be fitted with a pressure release device if used on gases.

Bailey & Mackey Bourdon Tube gauges are fitted with such a device.

Safety Pattern

It is a mandatory requirement of BS EN837 section 5:11 that gauges of maximum scale values above 25 bar (363 lbf/in²) shall be of the safety pattern type if used on gases (steam is classed as a gas).

Bailey & Mackey Safety Pattern Gauges have a solid baffle integral with the case, an energy release device at the rear of the case and an acrylic window.

Pressure gauges to this specification are marked ‘SAFETY PATTERN’ on the dial. Pressure gauges above 25 bar (363 lbf/in²) with ‘HYDRAULIC’ marked on the dial must not be used on gases.

For Acetylene or Oxygen use please contact our technical department.

Liquid Filling

Liquid filled pressure gauges are recommended for applications where they are subject to conditions of severe vibration. The liquid in the gauge case lubricates the mechanism and damps down oscillations.

In conditions involving rapid pressure pulsation mechanism wear will be reduced and there may be a slight damping effect. Liquid filled gauges are sealed therefore condensation is not noticeable and corrosive atmospheres cannot enter the gauge case.
Type 73

Bourdon Tube Pressure Gauges

Of high quality and robust construction, this range of instruments is designed for use in most industrial applications where the fluid used is not aggressive to copper alloys.

- 50mm to 250mm Diameter
- Direct Mounting

These pressure gauges are designed to withstand high levels of shock and vibration. They are robust, high quality instruments ensuring long life and sustained accuracy under the most arduous conditions.

- 30mm Nominal Diameter
- Direct Mounting
- Centre Back Connection
- Maximum Pressure 350 bar
- Accuracy ±5% FSD
- Robust Construction
- Blow Off Rear Vent for Gas Service
- Optional Oxygen Service
- Enclosure Rating IP54

Applications
These gauges can be used with all fluids that are compatible with copper alloys and can accept static pressures up to 75% FSD or dynamic pressures up to 65% FSD. If oxygen or breathing air is used as the pressure fluid please inform us when ordering.

Materials of Construction
Case .......................... Brass-Black nickel plated
Bezel .......................... Brass-Black nickel plated
Window ....................... Perspex
Sensing element .......... Phosphor Bronze or Beryllium Copper depending on range
Connection ................. Brass
Options ....................... Please discuss with our technical sales office. For example:-
                       - The connection thread can be supplied in any size up to 8mm diameter.
                       - Dial layouts can be supplied to suit the application.
                       - Alternative finishes are also available.
These pressure gauges are designed to withstand high levels of shock and vibration. They are robust, high quality instruments ensuring long life and sustained accuracy under the most arduous conditions.

- 40mm Nominal Diameter
- Direct Mounting
- Centre Back Connection
- Maximum Pressure 400 bar
- Accuracy ±2% FSD
- Robust Construction
- Blow Off Rear Vent for Gas Service
- Optional Oxygen Service
- Enclosure Rating IP54

Applications

These gauges can be used with all fluids that are compatible with copper alloys and can accept static pressures up to 75% FSD or dynamic pressures up to 65% FSD. If oxygen or breathing air is used as the pressure fluid please inform us when ordering.

Materials of Construction

Case .........................Brass-Black nickel plated
Bezel .........................Brass-Black nickel plated
Window .......................Perspex
Sensing element.......Phosphor Bronze or Beryllium Copper depending on range
Connection ..............Brass
Options .....................Please discuss with our technical sales office. For example:- The connection thread can be supplied in any size up to 8mm diameter. Dial layouts can be supplied to suit the application. Alternative finishes are also available.

Bourdon Tube Pressure Gauges Type 38EU

Connection 1/8" BSP

A  42mm
B  40mm
C  42mm
D  43mm
E  13mm
Of high quality and robust construction, this range of instruments is designed for use in most industrial applications where the fluid used is not aggressive to copper alloys.

- 50mm to 80mm Diameter
- Direct Mounting
- Centre Back Connection
- Max. Pressure 700 bar
- 1 bar Vacuum
- Combined Pressure & Vacuum
- Accuracy ±1% FSD (50 mm dia. ±2% FSD)
- All Metal Construction
- Full size sensing element
- Enclosure rating IP54

**Type 82** is for use on liquids up to 700 bar and gases up to 25 bar.

**Type 82SP** is a full safety pattern gauge with energy release at the rear and is for use on gases above 25 bar.

### Materials of Construction

- **Case** .................................................. Steel
- **Bezel** ................................................ Brass
- **Window**
  - Type 82 ................................................ Instrument Glass
  - Type 82SP .............................................. Perspex
- **Sensing Element**
  - up to 250 bar ........................................ Phosphor Bronze
  - above 250 bar ........................................ Steel
- **Movement** ............................................ Brass
- **Connection** .......................................... Brass
- **Finish** ................................................ Black Enamelled

**All Bailey & Mackey Pressure Gauges can be adapted to meet the users application.**

- e.g. The connecting thread can be modified.
- The dial can be scaled in any unit and company logo's incorporated.
- The colour of the case & bezel can be changed.

For these and other modifications please contact our Technical Sales Department.

Bourdon Tube Pressure Gauges

Of high quality and robust construction, this range of instruments is designed for use in most automotive applications. Matching temperature gauges can be found in our temperature gauge catalogue. The gauges can be supplied with either light slots in the case or with internal illumination.

- 52mm Diameter
- Panel Mounting with Clamp Fixing
- Rear Connection
- Max. Pressure 210 bar
- 1 bar Vacuum
- Combined Pressure & Vacuum
- Accuracy ±2.5%
- All Metal Construction
- Gauge Face Weatherproof
- 3 Hole Fixing Adaptor (optional)
- Internal Illumination (optional)

All Bailey & Mackey Pressure Gauges can be adapted to meet the users application.

e.g. The connecting thread can be modified.
The dial can be scaled in any unit and company logo’s incorporated.
The colour of the case & bezel can be changed.

For these and other modifications please contact our Technical Sales Department.
Type 73PT & PTA Potentiometric Pressure Gauges

Pressure gauge with high output signal. Designed to give pressure indication and electrical output signal for distant reading in one unit and only one pressure tapping.

- Gauge ranges up to 600 bar
- Potentiometric or 4-20 mA output
- 150mm Diameter pressure indication
- Supplied with 1M flying lead
- Weight 1.18kg
- Pressure connection 1/2” BSP male (alternatives available)
- Bourdon tube sensing element

PART No. 73 PT for voltage output
PART No. 73 PTA for 4-20 mA output
Alternative ranges available

Accuracy ..................±1%
Output .....................73PT Ratiometric
73 PTA 4-20 mA

Gauge pressures
For use with materials compatible with brass and phosphor bronze

Ranges

-1/0 bar  0/4 bar  0/25 bar  0/160 bar
0/1 bar  0/6 bar  0/40 bar  0/250 bar
0/1.6 bar  0/10 bar  0/60 bar  0/400 bar
0/2.5 bar  0/16 bar  0/100 bar  0/600 bar

All Bailey & Mackey Pressure Gauges can be adapted to meet the users application.

- The connecting thread can be modified.
- The dial can be scaled in any unit and company logo’s incorporated.
- The colour of the case & bezel can be changed.

For these and other modifications please contact our Technical Sales Department.

Wiring Diagram

Note: The coil will be damaged if full load is applied to the wiper.
Output: 0/2000 ohms (ranges up to 2.5 bar)
0/1570 ohms (ranges 4 bar and above)
minimum load independance 4K ohms

Supply: 60V dc max regulated
max current 12mA

Output: 4-20mA
2 wire current loop
max load impedance 400ohms

Supply: 12 to 24V dc

Note: If the wiring is reversed there will be no signal.
Test Accuracy Gauges are supplied to laboratory & Inspection Departments for the recalibration of industrial accuracy pressure equipment.

- 100, 150 & 200mm diameter
- Direct Mounting Type 73T
- Panel Mounting Type 81T
- Accuracy ±0.25% FSD
- Mirror scale to reduce parallax errors
- Single or Dual Scale
- With Calibration Certificate

For dimensions of Type 73T see Type 73
For dimensions of Type 81T see Type 81

The mechanisms of our test gauges are specially built to a high standard and the dial of each gauge is individually calibrated against Dead Weight equipment which is traceable to National Standards with NAMAS certification.

A calibration certificate is supplied with each test gauge.

Test gauges have a greater number of marks on the dial compared to an industrial gauge and we recommend that the maximum is 200 as more than this can cause confusion.
Type 73DPT & 73DPT  Duplex Pressure/Temperature Gauges

These gauges are intended for use where pressure and temperature are to be measured from one tapping port. A typical application is in boiler installations where the pressure and the temperature of the hot water needs to be seen.

- 80 mm Diameter
- Bottom or Centre Back Connection
- 0 to 20 bar / 30 to 150°C Ranges
- Stainless Steel Wetted Parts
- Extended Stem to Pass Through Insulation

Type 73DPT has a bottom connection.
Type 82DPT has a centre back connection.

Materials of Construction

Case................................................. Black Enamelled Steel
Bezel.............................................. Black Enamelled Steel

Connection..................................... Stainless Steel

All Bailey & Mackey Pressure Gauges can be adapted to meet the users application. e.g. The connecting thread can be modified. The dial can be scaled in any unit and company logo’s incorporated. The colour of the case & bezel can be changed.

For these and other modifications please contact our Technical Sales Department.
Duplex Pressure/Temperature Gauges Type 73DPT & 73DPT

Connection 'A'

Both types of gauge can be supplied with 1/4" BSP P,
1/4 BSP T or 1/4" NPT connection thread.
Type 73E & 82E Switch Function Pressure Gauges

These gauges allow for the indication of pressure with an electrical switch point that can be factory pre-set for either a normally open or normally closed function.

These gauges can be used for the control of pumps, to indicate the contents and signal a loss in maintained pressurized systems.

- 63mm Diameter
- Bottom or Back Connection
- Accuracy ±2.5% FSD
- Direct Mounting
- Max. Pressure 400 bar
- SPDT Micro-switch

Type 73E has a bottom connection.
Type 82E has a centre back connection.

Electrical Rating
5A at 250v a.c. for d.c. ratings, please contact our technical department.

Process Connection
1/4” BSP Parallel male; 1/4” BSP Taper male or 1/4” NPT male

Materials of Construction
Case & Bezel .................................. Stainless Steel

All Bailey & Mackey Pressure Gauges can be adapted to meet the users application.
e.g. The connecting thread can be modified.
The dial can be scaled in any unit and company logo’s incorporated.
The colour of the case & bezel can be changed.

For these and other modifications please contact our Technical Sales Department.
Portable Test Pump Kit

Application
The Bailey & Mackey Portable Test Pump is ideal for on site checking and inspection of pressure gauges, pressure switches and pressure transducers. In fact, any application where pressure is required in a handy portable unit for routine tests.

Specifications
The brass Test Pump is suitable for pressures up to 400 bar. Water or other suitable calibration fluid is compressed by a piston moving in a cylinder. Pressure readings are taken from a 150mm diameter pressure gauge, with a suitable pressure range and compared with the unit under test. Standard pressure gauges are calibrated to a commercial accuracy of +/- 1% of full scale value; but a Test Accuracy gauge calibrated to an accuracy of +/-0.25% of maximum scale value can be supplied if required.

The set is supplied in a case complete with spanner and adaptors to take 3/8”, 1/4” and 1/8” bsp male threads. The connections on the pump and gauge are 1/2” bsp male threads.

Also Available
A 1 metre length of heavy duty plastic tube with pressure connections and a shut-off valve for checking panel mounted pressure gauges without dismantling from the panel.

A right-angle adaptor for checking gauges with back connection.

A battery operated unit for accurately setting pressure switches. Leads from the unit are connected to the pressure switch terminals; a lamp lights when the switch contacts close at the set pressure.
Pressure Gauge

Options

Receiver Gauges

Pneumatic control systems using 3 – 15 lbf/in² (0.2 – 1 bar), the pressure in a process fluid is transmitted from the tapping point to the control by a proportional signal. Pressure Gauges can be calibrated to indicate this signal.

Zero on the dial being 3 lbf/in² (0.2 bar) and full scale 15 lbf/in² (1 bar). Receiver gauge scales may be graduated 0 – 100%, 3 – 15 lbf/in² etc, or in other units such as °C, Litres per hour, square root etc. as required by the system.

Movement of the Bourdon Tube is restricted by an internal stop below 3 lbf/in² (0.2 bar), allowing the pointer to drop below zero when no pressure is applied.

Accuracy

- normally ±1% FSD
- special calibration ±0.5% FSD

Setting Pointer

When maximum pressure is required to be indicated, which is below the full scale value of the pressure gauge an adjustable pointer can be fitted either to the dial or to the window, so that the secondary pointer can be set to the point on the dial at the maximum reading.

Maximum Pointer

If the maximum pressure in the system is required to be shown until reset manually a slave pointer can be fitted to the window of the pressure gauge which remains in position when the pressure reduces.

This slave pointer can also be used as a minimum pressure indicator if adjusted to the gauge pointer once the system is running. An allowance for the drag that this finger causes should be added to the general tolerance of the gauge to which it is fitted, normally 1%.
**Electric Contacts**

Where an electric circuit is required at a specific pressure an electric contact unit can be fitted to the front of a pressure gauge. A dished transparent plastic housing, which replaces the normal window, contains the contacts which can give opening or closing circuits.

These contacts can be fitted to 100 mm & 150 mm diameter gauges only. They are available for pressure ranges of 1 bar and above.

An increased tolerance of 1½% above the respective gauge tolerance is required to accommodate the effect that contacts have on normal pressure gauges.

To alleviate the effects of contact bounce and to ensure secure switching magnetic contacts are used. Contacts are set by means of a removable key which fits in the central boss of the contact housing.

When electric contacts are fitted the pressure gauge should be installed in the vertical position and protected from humidity, vibration and pressure pulsation.

**Applications**

Electric contact gauges are normally used for high or low level alarm, for control of pumps or compressors etc.

Due to the low energy switching the contacts should be connected into the control circuit via a relay.

**Electric Rating**

- Alternating Current .......... 50VA
- Direct Current ................ 30 Watts

**Contact Forms**

- Single contact .................. Make on rising pressure
  - Make on falling pressure
- Twin contacts ..................... Any combination rising and/or falling
- Triple contacts ................. Any combination of the above

Contacts can not be configured to give a changover function. If this is required we recommend that a relay is used.
Diaphragm seals or chemical seals are used with bourdon tube gauges to provide a barrier between a corrosive fluid and a bourdon tube pressure gauge. They can be used to prevent paint, slurry, powder etc blocking the bourdon tube.

The cavity above the diaphragm and the passageway in the bourdon tube gauge is filled with a non-aggressive fluid which transmits the pressure exerted on the diaphragm of the diaphragm seal to the bourdon tube in the gauge.

The filling should be done under vacuum which removes all the air from the filling media which gives a better accuracy than filling at atmospheric pressure.

Diaphragm seals are one way of satisfying aggressive applications, but before selecting a diaphragm seal we would recommend that Diaphragm Gauges are used as they give a better solution. For example in a diaphragm gauge there is no liquid filling which is a major disadvantage when using a bourdon tube pressure gauge fitted to a diaphragm seal.

See our catalogue illustrating our range of Diaphragm Gauges.

Bailey and Mackey manufacture two sizes of diaphragm seals which can be selected for the size of gauge being used.

**Type Z140**
This diaphragm seal is in stainless steel construction only and is intended for use on bourdon tube pressure gauges up to 80 mm diameter.
Maximum Pressure..............400 bar

**Type Z800**
This diaphragm seal can be supplied with various wetted parts selected from the chemical compatibility chart illustrated.
The Z800 diaphragm seal is intended for use with bourdon tube gauges above 80 mm diameter although it can be used with smaller diameter gauges.
Maximum Pressure..............200 bar
Flush Diaphragm Flanges

Applications that are of a hygienic nature or ones that are using fluids (granules or powders) that are likely to block the pressure passage of bourdon tube gauges can be fitted with diaphragm seals which have a stainless steel diaphragm electron beam welded to the bottom face of the seal. Bailey & Mackey can supply hygienic fittings and flanges in this form.

Dimensions of cocks and syphons supplied may vary slightly from those given above.

A range of ball valves is available for pressures above 14 bar, these have double female connections.
Bailey & Mackey’s pressure gauge ranges are to BS1780 for single scale, vacuum and combined pressure and vacuum dials. Dual scale dials are based on the ranges shown in BS1780 with the major scale being the inner one. Other dial markings are also available including the addition of company names and logo’s.

Installation and Use

A Pressure Gauge correctly installed and to the correct specification gives indication of pressure in the system which helps to ensure the safe working of process plant machinery.

a) Before fitting the gauge to a pressure source check that the maximum scale value of the gauge is higher than the pressure to be applied. The applied pressure should be 75% of maximum scale value for steady pressures or 65% of maximum scale value for fluctuating pressures.

b) Before fitting the gauge to a pressure source check that the wetted parts are compatible with the fluid being used, and that the pressure connection correctly matches that of the pipework.

c) When fitting the gauge to the pipework, use correct sealing methods. Do not use the gauge case to tighten the gauge to the pipework, use a correct size spanner on the neck hexagon.

d) For gas applications ensure that a safety pattern gauge is used for pressures over 25 bar (363 lbf/in²).

e) Gauges marked “Hydraulic” must not be used on compressed gases.

f) Pressure Gauges with blow-out release at the back must be mounted at least 20mm away from a panel or wall to ensure safe dissipation of the confined pressure should the tube fracture.

g) Do not use gauge for oxygen or acetylene unless approved by our Technical Department. Gauges must have “Oxygen” or “Acetylene” marked on dial if used on these gases.

h) Do not use glycerine filled gauges for any fluid which has strong oxidizing agents for example chlorine, hydrogen peroxide, nitric acid, etc.

i) If the pressure gauge is to be subject to vibration, pressure surges, pressure pulses or over pressure, consult our Technical Department for approval before use.

j) The ambient and process temperature acting on the gauge should be within -20°C and + 80°C and protected from higher fluid temperature by means of a syphon tube filled with condensate before use. The fluid in the pressure chamber should not be allowed to freeze or crystallise as this will lead to rupture of the sensing element.

k) Should the pointer of any pressure gauge not return to zero, when the pressure is removed, it is an indication that damage to the gauge has occurred and the gauge should be replaced immediately.

If in doubt concerning the application of any pressure gauge please contact our Technical Department who will be only too pleased to give you advice.
## Pressure Gauge

### Conversion Factors

Multiply units in left hand column by factor to obtain units at top. i.e. bar x 14.504 = lb./in²
