Keeping pressure under control

AN ISO 9000 COMPANY
Bailey & Mackey Pressure Gauges measure pressures relative to atmospheric pressure and are divided into three groups, each group being based on a different measuring principle.

**Bourdon Tube Gauges** consist of a formed tube with one end fixed and the other end free to deflect under pressure. This type of gauge is only available for applications where the material of the tube (e.g. Beryllium Copper or Stainless Steel) is compatible with the fluid in the system. The maximum pressure that we manufacture these gauges to is 700 bar (10000 psi). Illustrated in our Bourdon Tube Pressure Gauges catalogue.

**Diaphragm Gauges** consist of a metal diaphragm which deflects under pressure. This type of gauge is extremely versatile as materials and coatings can be used which will resist corrosion and consequently can be adapted for use with the majority of fluids. The maximum pressure that we manufacture these gauges to is 70 bar (1000 psi). Illustrated in this Catalogue.

**Differential Gauges** consist of a metal diaphragm which deflects under pressure such that the difference of two pressures is registered on an analogue gauge face. The maximum pressure difference is 25 bar and the maximum static (line) pressure is 34 bar. Illustrated in this Catalogue.

**Bellows Gauges** consist of a metal bellows which expand/contract when pressure/vacuum is applied. This type of gauge is used for low pressures up to 500 mbar (200 in. H₂O). Illustrated in our Diaphragm Catalogue.

Bailey & Mackey Pressure Gauges can be supplied for measuring vacuum although absolute pressure gauges are not included in our range.

**Temperature Gauges** utilise both the bourdon tube and vapour pressure principle. A temperature sensing element is connected to the bourdon tube via a length of capillary or rigid stem. Liquid contained in the element, when subject to heat, converts to a gas pressure which deflects the tube. Illustrated in our Bourdon Tube Pressure Gauges Catalogue.

At Bailey & Mackey Pressure Gauges can be modified to suit almost any requirement. Please contact our Sales Office for technical assistance.

Bailey & Mackey have been manufacturing high quality pressure instruments for over 75 years. The product range has been extended over this period and we now manufacture Pressure Gauges, Temperature Gauges, Pressure Switches and Pressure Transducers.

Our products satisfy most pressure and temperature sensing applications in many industrial markets including, Aerospace, Automotive, Chemical, Marine, Medical, Water, Waste, Fire, Food, Heating and Ventilating, and General Industries. In fact we have products which cover almost every pressure sensing application.

Expertise in pressure sensing technology enables us to manufacture to the highest standard of quality and reliability.

Our quality management system, which is approved by B.S.I. Quality assurance to BS EN 9001, ensures that all products have been correctly assembled and tested prior to despatch to our customers.

Bailey & Mackey aims to lead its chosen sectors of the Pressure Gauge, Temperature Gauge, Pressure Switch and Pressure Transducer Industry through excellence in customer service and product quality.

Bailey & Mackey – Pressure control experience and innovation for over 75 years.
Bailey & Mackey’s range of Diaphragm and Differential Pressure Gauges are built to the highest standards of workmanship required for such precision instruments. Each individual Pressure Gauge is subject to a series of the most stringent pressure and calibration tests before despatch.

Diaphragm Pressure Gauges

Applications

A diaphragm is a more mechanically stable element than a bourdon tube and can stand mechanical shock with less damage. Diaphragm Pressure Gauges can be used to indicate pressures below those practical for bourdon tube pressure gauges.

The diaphragm can be protected against aggressive liquids and gasses by fitting a thin flexible disc of resistant material as a barrier between it and the corrosive media. The pressure chamber or base can be made from a suitable material (see page 12). A Diaphragm Gauge is technically preferable to using a Bourdon Tube Pressure Gauge fitted to a chemical seal.

They can be used on viscous liquids, powders, and slurries, with the connection having a large entry passage or the diaphragm can be fitted directly onto pipe flanges or hygienic fittings.

Diaphragm Gauges can be adapted to meet stringent operating conditions for example, they can be fitted with overload protection, they can have pulsation dampers fitted above the working diaphragm (see pages 13 and 14).

Differential Pressure Gauges

Applications

Differential Pressure Gauges are used to measure the difference in pressure between two points in a pressurised system.

They can be connected across filters to indicate the condition of the filter, or across a boiler to play an important part in energy management. They can be used to measure the content of a pressurised tank. They can be calibrated with square root scales to measure the flow through orifice plates, pitot tubes, venturis or pumps.

Design

Using a diaphragm with pressure applied to either side allows for higher static (line) pressures than a double bourdon tube differential pressure gauge when measuring low pressure differences. The diaphragm chambers are machined to restrict movement of the diaphragm under out-of-balance pressures greater than the maximum calibration of the gauge. With balanced pressure chamber the accuracy does not vary with changes in static pressure.

It is recommended that a bypass valve is connected between the high and low pressure chambers, this valve is opened when the system is started and closed when the system is running at full system pressure.

Temperature

Both Diaphragm and Differential Pressure Gauges should not be exposed to excessive heat or cold since this causes them to indicate incorrectly and if the measured fluid is allowed to freeze damage can occur to the diaphragm.
Type 65, 66, 67 & 68 Low Pressure Diaphragm Gauges

- 100 and 160 mm Diameter
- Maximum Pressure 400 mbar
- Maximum Vacuum 400 mbar
- Combined Pressure & Vacuum
- All Metal Construction

- Type 65 is Direct Mounting Bottom Connection
- Type 66 is Panel Mounting Centre Back Connection 3 Hole Fixing
- Type 67 is Panel Mounting Centre Back Connection Clamp Fixing
- Type 68 is Wall Mounting Centre Back Connection

Standard Calibrations

- 0 to 30 mbar or 0 to 12” H2O
- 0 to 50 mbar or 0 to 20” H2O
- 0 to 100 mbar or 0 to 40” H2O
- 0 to 160 mbar or 0 to 60” H2O
- 0 to 250 mbar or 0 to 100” H2O
- 0 to 400 mbar or 0 to 160” H2O

For Higher Pressures see page 8.

Special Dial Markings

Dials calibrated in other pressure units such as kN/m², MN/m², kPa, Kg/cm², cm water, meters of water, cm Hg, inches Hg etc single scale, dual scale or with square root markings can be supplied if required. An extra charge is made for special dial marking, dependent on the costs involved.

Combined Pressure and Vacuum

Gauges with dials marked positive and negative relative to atmospheric pressure to indicate pressure and vacuum on the same instrument can be supplied.

NOTE: Absolute Pressure Gauges are not available from Bailey & Mackey.

Accuracy ........................................ 1.5% of Maximum Scale Value
Temperature Coefficient.......................... 0.07% of range per 0°C from 20°C

For alternative connections see page 11.
For alternative wetted parts see page 12.
For variants see page 13, 14 & 15.

Type 65 Low Pressure Gauge Direct Mounting Bottom Connection

For Stainless Steel add 9mm to all dimensions for the 160mm diameter gauge.

Nominal Size A B C Weight
100mm 66.8mm 103mm 79.5mm 1.1kg
160mm 71.8mm 151mm 103.5mm 1.4kg

### Type 70, 70A & 70B Diaphragm Pressure Gauges

**Pressure Gauge Panel Mounting**

**Type 70A 3 Hole Fixing**

**Type 70B Clamp Fixing**

**Diaphragm Pressure Gauges**

**Type 70, 70A & 70B**

**Alternative Base Fittings**

Items A, B and C show flange fittings which can be supplied in either Mild Steel or 316 Stainless Steel. These are particularly useful on plant pumping viscous liquids or powders or where the gauge has to be removed for cleaning.

Flanges to ASA standards are also available. This is not an exhaustive illustration – Please enquire for the alternative that you need.

### Chemical Protection

**Pressure Conditions**

Standard materials for wetted parts are brass pressure chamber and beryllium copper diaphragm. This can be changed to make the wetted parts suitable for most other fluid applications. The diaphragm can be protected against corrosion, by a thin sheet of suitable material and the pressure chamber can be electro-plated or machined from a suitable material either metal or plastic.

Examples of suggested materials for use with a range of chemicals are given in the tables below; these are only suggestions and it is the users responsibility to ensure that the material used is compatible with the chemicals used and the application conditions of concentration and temperature.

**Vacuum Conditions**

Diaphragm protection under vacuum conditions must be integral with the diaphragm.

On vacuum applications or where suction can occur a 17/7 precipitation hardened stainless steel can be used as an alternative to beryllium copper. 17 / 7ph is less corrosion resistant than 316 stainless steel but it can be hardened and tempered to give reasonable spring properties.

If this is not sufficiently resistant for the application the beryllium copper diaphragm can be electroplated or coated with a suitable plastic material.

### Diaphragm Gauges

- **Malleable Iron Base, 316 S.Steel Disc**
  - Acetylene
  - Alkyl Chlorides
  - Ammonia (Max 60°C)
  - Aniline
  - Calcium Chloride (Max 60°C)
  - Caustic Soda (Max 60°C)
  - Chlorides of Na, K, Mg
  - Hydrocyanic Acid
  - Pyridine

- **UPVC Base 1/2” BSP, PTFE Disc**
  - Max Temperature 40°C
  - Max Pressure 200 lbf/in²
  - Anhydrous Ammonia
  - Aluminium Chloride
  - Caustic Soda
  - Hydrobromic Acid (50%)
  - Hydrochloric Acid (36%)
  - Hydrogen Sulphide
  - Lead Acetate
  - Methanol
  - Oxalic Acid
  - Phosphoric Acid (50%)
  - Potassium Salts
  - Sodium Hypochlorite
  - Sodium Salts
  - Sulphuric Acid (70%)
  - Waste Gases

- **Silver Plated Base, Fine Silver Disc**
  - Brines
  - Bromine
  - Chlorine (wet or dry)
  - chlorates of Na, K, Ba
  - Chlorides of Na, K, Mg
  - Flourine
  - Mercuric Chloride
  - Ozone

- **316 Stainless Base and Disc**
  - Acetic Acid
  - Ammonium Hydroxide
  - Carbon Disulphide
  - Carbon Tetrachloride
  - Caustic Soda
  - Caustic Potash
  - Citric Acid
  - Formic Acid
  - Fruit Juices
  - Food Machinery
  - Hexamine
  - Hydrogen Peroxide
  - Oil-Phosphate Ester Based
  - Silver Nitrate
  - Water De-ionised

### Diaphragm Pressure Gauges

- **Diaphragm Gauge Transmitter**
  - 100mm and 160mm Diameter
  - For Viscous Liquids
  - Maximum Temperature 300°C
  - Will accept overload up to 25 bar
  - Used where a Syphon Tube cannot be fitted
  - For Bitumen Road Spraying Bars, Boilers and other high temperature applications

### Special Features

1. Pressure passage through the brass G½ (½” BSP) pressure connection is ⅝” dia. (9.5mm) instead of the normal 3mm (¼”) dia. This reduces the possibility of blockage when the liquid becomes cold and very viscous. If this is considered to be too small other designs of pressure connections are available, and also alternative materials as described on pages 11 and 12.

2. The 450mm of coiled small bore tube which connects the transmitter diaphragm to the working diaphragm, has the effect of damping out pressure pulsations as well as providing a temperature gradient.

3. Transmitter liquid is normally Shell Calibrating Fluid; for special applications the following alternatives have been used – paraffin, distilled water, glycerine, vinegar, or silicone only where temperatures above 140°C are involved.

4. An overload stop is fitted above the working diaphragm so that gauges will not be damaged by high pressures which may be generated starting from cold or changing from off-load recirculate to on-load spray.

**NOTE:** The flange-clamping bolts must not be slackened as this will break the pressure seal and render the gauge inoperative.

### Method of Operating

Pressure is applied to a flexible thin stainless steel transmitter diaphragm clamped between the lower flanges. Deflection of this lower diaphragm transmits the pressure up the liquid filled coiled tube to the “working” diaphragm clamped between the upper flanges. Movement of the working diaphragm is indicated by the gauge pointer via a mechanism in the normal way.

The working diaphragm and gauge mechanism are situated far enough away from the hot fluid for the reading not to be affected by fluid temperatures up to 300°C.
In many applications where diaphragm gauges are used it is not possible to protect the mechanism against the effect of pulsating pressures by means of a snubber involving a small orifice in the line to the gauge. This particularly applies where the application is on suspended solids or there is a hygiene requirement. The Bailey & Mackey solution to the problem is integral hydraulic throttling.

The drawing shows how this is achieved. The diaphragm pressure gauge is assembled with a plate which has 2 oil filled chambers which connect through a scintered filter. Pressure in the system is transmitted via the lower stainless steel diaphragm to the working diaphragm on the gauge and pressure pulsations slowed down at the scintered filter with no danger of blockage.

Please note: the 2 hexagon head screws at the side of the plate are used for filling the two chambers with oil. These should never be slackened because loss of oil will cause the gauge to read incorrectly and, in extreme cases, could rupture the transmitter diaphragm.

It is recommended that the working pressure of gauges should be 2/3 of the range for fluctuating pressures or 3/4 for steady pressures. Overload will strain the diaphragm causing distortion which will put the gauge out of calibration.

Normally the pressure range should be chosen to cover the highest pressure likely to develop in the system, but gauges can be built with a moulded resin diaphragm support which prevents excessive deflection under over-pressure.

The drawing shows how this is achieved by adding a support plate above the diaphragm to hold the resin. Maximum overload pressure is 1000 lbf/in². Temperatures above 60°C are not recommended.
Differential Pressure Gauges

### Applications

- Balanced Pressure Chambers
- Safe Against Pressure Surges
- Unbalanced Pressure Protection
- Accuracy Unaffected by Static Pressure Changes
- Calibrated to Read Both Rising and Falling Pressures
- Can be Calibrated to have a Center Zero Indicating Pointer

### Chemical Protection

For aggressive chemicals both sides of the differential pressure gauges can be fitted with diaphragm seals which protect the gauges from chemical attack. (see page 12 for chemical compatibility charts)

### Specification

The two pressures are applied to either side of a spring diaphragm. The accuracy of these gauges does not vary with changes in line pressure because the two pressures act on opposite sides of the one element that has equal areas.

The diaphragm chamber is machined to restrict movement of the diaphragm under out-of-balance pressures greater than the maximum calibration of the gauge.

### Special Dial Markings

Dials calibrated in other pressure units such as kN/m², MN/m², kPa, Kg/cm², cm water, meters of water, cm Hg, inches Hg etc single scale, dual scale or with square root markings can be supplied if required. An extra charge is made for special dial marking, dependent on the costs involved.

### Overload

Dimensions of the diaphragm housing are such that the movement of the diaphragm is stopped when the pressure difference exceeds the full scale deflection. The gauge will accept the accidental application of up to 4 times the range without damage except for a small calibration error. Under working conditions the pressure difference should not exceed the full scale value of the gauge. This overload should not preclude the installation of a balancing valve in all applications where differential pressure gauges are used (see page 23).

- **Type 91** is Panel Mounting 3 Hole Fixing.
- **Type 92** is Panel Mounting Clamp Fixing.
- **Type 93** is Direct Mounting.
- For Stainless Steel Add a Suffix S to the above Part Numbers (Type 92 & 93 only)
- For GlycerineFilled Gauges Add a Suffix G to the above part Numbers (Type 92 & 93 only)

### Materials of Construction

- Wetted Parts ............... Brass with Beryllium
- copper Diaphragm
- Seals ..................... Nitrile Rubber
- Case 80 & 100mm dia .... Mild Steel Black Enamelled
- Bezel 80 & 100mm dia ... Mild Steel Black Enamelled
- Bezel 160mm dia ........... Black ABS Plastic

### Alternatives Available

- Wetted Parts ............... Stainless Steel
- Seals ..................... Viton
- Case & Bezel ............... Stainless Steel

### Accuracy

- ± 1.5% full scale deflection
- Temperature .................. 80°C Maximum
- (a temperature coefficient of 2% over 30°C can be expected)

### Applications

When these low pressure gauges are used on liquids both connections and the tapping points should be in one horizontal plane. If not, allowance should be made for differences in the height of liquid in the connecting pipes. Bleed ports can be provided at the highest point of the pressure chambers if required.

---

**Type 91, 92, 93, 95, 96 & 97 Differential Pressure Gauges**

- 80, 100 mm and 160 mm Diameter
- Maximum Pressure 6 bar
- Out of balance Pressure 4x range
- Accuracy 2% Full Scale Deflection
- All Metal Construction

**Standard Calibrations**

- 0 to 0.6 bar or 0 to 10 p.s.i.

For Higher Pressure ranges see page 17.

Special Dial Markings

Dials calibrated in other pressure units such as kN/m², MN/m², kPa, Kg/cm², cm water, meters of water, cm Hg, inches Hg etc single scale, dual scale or with square root markings can be supplied if required. An extra charge is made for special dial marking, dependent on the costs involved.

Overload

Dimensions of the diaphragm housing are such that the movement of the diaphragm is stopped when the pressure difference exceeds the full scale deflection. The gauge will accept the accidental application of up to 7 bar (100 p.s.i.) without damage except for a small calibration error. Under working conditions the pressure difference should not exceed the full scale value of the gauge. This overload should not preclude the installation of a balancing valve in all applications where differential pressure gauges are used (see page 23).

- Type 95 is Panel Mounting 3 Hole Fixing
- Type 96 is Panel Mounting Clamp Fixing
- Type 97 is Direct Mounting
- For Stainless Steel add a suffix S to the above part numbers (Type 96 & 97 only)

Materials of Construction

- Wetted Parts:............Brass with Beryllium Copper Diaphragm
- Seals:................Nitrile Rubber
- Case 100mm dia...Mild Steel Black Enamelled
- Case 160mm dia...Aluminium Black Enamelled
- Bezel 100mm dia...Mild Steel Black Enamelled
- Bezel 160mm dia...Black ABS Plastic

Alternatives Available

(above 250 mbar (100°H2O))

- Wetted Parts:............Stainless Steel
- Seals:................Viton
- Case & Bezel:...........Stainless Steel

Accuracy ..............± 2% full scale deflection

Temperature ..........80°C Maximum
(a temperature coefficient of 2% over 30°C can be expected)

Applications

When these low pressure gauges are used on liquids both connections and the tapping points should be in one horizontal plane. If not, allowance should be made for differences in the height of liquid in the connecting pipes. Bleed ports can be provided at the highest point of the pressure chambers if required.

Nominal size  
100mm diameter  
Weight 1.75kg  

Nominal size  
160mm diameter  
Weight 1.75kg  

Type 95 is Panel Mounting 3 Hole Fixing  
Type 96 is Panel Mounting Clamp Fixing  
Type 97 is Direct Mounting  
For Stainless Steel add a suffix S to the above part numbers (Type 96 & 97 only)
Type 95, 96 & 97 Low Pressure Differential Pressure Gauges

Type 95 Panel Mounting 3 Hole Fixing

Pressure Connections are at 3 o’clock and 9 o’clock when viewed from the front of the gauge the high pressure port is on the left side of the gauge and the low pressure port is on the right side of the gauge.

Type 96 Panel Mounting Clamp Fixing

Type 97 Direct Mounting with optional wall fixing brackets attached

Applications

Changes in differential pressure indicated by a differential pressure gauge are only apparent if an operator is available to look at the instrument.

An automatic warning signal on high or low conditions can be provided by a Bailey & Mackey differential pressure switch.

The photograph and drawing show a 100mm (4”) dia Type 93 differential pressure gauge and Type 1382 differential pressure switch piped up together as a convenient means of providing both indication and alarm or control. This unit comes complete with brackets for wall mounting.

A flush panel mounted version is available in the 160mm (6”) dia size only; a drawing showing this arrangement is available if required.

The Type 1382 differential pressure switch has an electric rating of 10A at 250V AC and can be wired directly to a warning light or buzzer.

Lower Pressure Ranges

Both the wall mounted and 160mm flush mount versions are available with a range of 250mbar; use of a differential pressure switch on this low pressure provides a much more stable electric switching operation than that obtained from contacts operated by a gauge pointer.

The general arrangement of low pressure Type 97 differential pressure gauge and Type 1482 differential pressure switch assembly is similar to that shown here except that pressure connections are further apart, conduit connection is at one side and the vertical distance between mounting slots is greater. A drawing showing dimensions is available if required.

For Type 97 all other dimensions are as for Type 95 above except that the panel mounting bezel is replaced by a plain bezel.
Differential Pressure Gauge with Differential Pressure Switch

**Differential Pressure Gauges**

**Differential Pressure Gauge with Differential Pressure Switch**

**Standard Calibrations**
- 250 mbar or 100"H2O
- 400 mbar or 160"H2O
- 1 bar or 15 p.s.i.
- 2.5 bar or 40 p.s.i.
- 4 bar or 60 p.s.i.
- 6 bar or 100 p.s.i.

Maximum Line Pressure ...34 bar (500 lbf/in²)

**Accuracy** ±1.5% Full Scale Deflection

**Materials of Construction**
- Wetted parts ...Brass
- Diaphragm ...Beryllium Copper
- Seals ...Nitrile
- Connecting pipes ...Copper
- Fittings ...Brass

**Alternatives Available**
- Stainless steel wetted parts.
- Viton seals.

**Electric Rating**
The differential pressure switch has a SPDT microswitch rated at 10 amps at 250 volts AC single phase. Standard conduit fitting is 20mm.

**Wiring Instructions**
Remove lid and terminal cover.
Use terminals 1 and 2 (or C and NC) for closed circuit below operating pressure.
Use terminals 1 and 3 (or C and NO) for closed circuit above operating pressure.

**Adjustment**
One quarter turn of the adjusting nut in a clockwise direction will lower the set point by approximately 10% of the maximum range of the switch and vice versa.

**Additional Features**
A mechanism for increasing the pressure difference between operation and reset can be fitted for control applications.
Differential pressure switches can be built with two microswitches to give two circuits with independently adjustable set points.

**Installation**
Ensure that the differential pressure gauge range, maximum line pressure and materials are correct for the application.
As the gauge is a delicate instrument it should not be mounted in a position where it is vulnerable to damage.
Connect the high pressure and low pressure connections to the appropriate tapping points. In applications involving flow where differences in line pressure between the two connections are always within the range of the gauge there is no need to fit valves.
In cases where there may be a sudden pressure surge on start-up, such as may come from a pump, it is necessary to fit isolating valves on each leg and link the pipes between each valve and the differential pressure gauge by a line with a third valve used for balancing.
Start-up routine with valves:-
1. Run system with all three valves closed until equilibrium is reached.
2. Open the balancing valve between the high and low pressure connections.
3. Open both isolating valves.
4. Close the balancing valve.
5. The differential pressure gauge will then indicate the pressure differential between the two tapping points.

**Maintenance**
No maintenance is required on those differential pressure gauges.

**Temperature**
Suitable for use over the range 0-80°C. When used with hot water or steam the connections should be made via a 500mm length of copper tube with a coil in it to cool the fluid before it reaches the gauge.
Installation and Use

A Pressure Gauge correctly installed and to the correct specification gives indication of pressure in the system which helps to ensure the safe working of process plant machinery.

- Before fitting the gauge to a pressure source check that the maximum scale value of the gauge is higher than the pressure to be applied. The applied pressure should be 75% of maximum scale value for steady pressures or 65% of maximum scale value for fluctuating pressures.

- Before fitting the gauge to a pressure source check that the wetted parts are compatible with the fluid being used, and that the pressure connection correctly matches that of the pipework.

- When fitting the gauge to the pipework, use correct sealing methods. Do not use the gauge case to tighten the gauge to the pipework, use a correct size spanner on the neck hexagon.

- Do not use gauge for oxygen or acetylene unless approved by our Technical Department. Gauges must have “Oxygen” or “Acetylene” marked on dial if used on these gases.

- Do not use glycerine filled gauges for any fluid which has strong oxidizing agents for example chlorine, hydrogen peroxide, nitric acid, etc.

- If the pressure gauge is to be subject to vibration, pressure surges, pressure pulses or over pressure, consult our Technical Department for approval before use.

- The ambient and process temperature acting on the gauge should be within -20°C and + 80°C and protected from higher fluid temperature by means of a syphon tube filled with condensate before use. The fluid in the pressure chamber should not be allowed to freeze or crystallise as this will lead to rupture of the sensing element.

- Should the pointer of any pressure gauge not return to zero, when the pressure is removed, it is an indication that damage to the gauge has occurred and the gauge should be replaced immediately.

- Multiply units in left hand column by factor to obtain units at top. i.e. bar x 14.504 = lb./in²
